

THIRD SUPPLEMENT TO "A CATALOG OF THE MOSQUITOES OF THE WORLD" (DIPTERA: CULICIDAE)

RONALD A. WARD^{1,2}

ABSTRACT. Additions and changes in the taxonomic status of mosquitoes from January 1984 through January 1992 are enumerated with the pertinent literature citations. Through this eight-year period, there were described nine new subgenera, 128 new species and one new subspecies. One subgenus, 25 species and 16 subspecies or varieties were removed from synonymy. The status of 66 taxa, including synonyms, were changed by transfers in generic or subgeneric status. Since 1984 there has been a net change of 145 species added to the world mosquito fauna, resulting in a total of 3,209 valid species.

INTRODUCTION

Eight years have passed since the publication of the second supplement to the world catalog of mosquitoes (Ward 1984). Since there are no plans for a revision of the world catalog of Knight and Stone (1977) in the near future, this supplement has been compiled to cover the systematic literature from January 1, 1984 through January 31, 1992.

The arrangement of this supplement is similar to that of the second supplement (Ward 1984) except that additional information is provided concerning the sex or stage of the holotype, changes in the deposition of type material and 24 Taxonomic Notes.

All publications containing descriptions of new taxa, revisions and catalogs have been examined with one exception, Lei 1989. In cases where further clarification was required, correspondence with an author or collection manager usually provided the necessary information. Such material is discussed in the Taxonomic Notes.

Valid taxa are indicated by italicized type

while synonyms are underlined and in roman type. The life history stages described in the original paper are indicated by the symbols: ♂ (male), ♀ (female), P (pupa), L (larva), E (egg), Pe (pupal exuviae) and Le (larval exuviae). An asterisk (*) to the right of a symbol indicates an accompanying illustration of at least a portion of the stage described. Type depositories are referenced by a three- or four-letter abbreviation. With the exception of 11 depositories cited at the end of this paper, the full locations for types are listed in Knight and Stone (1977), Knight (1978) and Ward (1984).

A change has been made for dating papers published in the calendar year following the date printed on the cover of the periodical. To simplify bibliographies, such a paper is listed as: Smith, J. 1990. A new species of . . . (Diptera: Culicidae). *J. Mosq. Res.* (1989) 23:391-397, rather than: Smith, J. 1989 (1990), etc. Complete citations for references given in the synonymies may be found in Knight and Stone (1977), Knight (1978) and Ward (1984).

A number of new synonyms were cited in the Culicidae chapter (Minar 1991) of the Palaearctic Diptera catalog. Since no indication was given for a reference substantiating the new synonymy, and a letter to J. Minar elicited no response, these synonymies are not mentioned in this supplement.

¹ The views of the author do not purport to reflect the position of the Department of the Army or of the Department of Defense.

I wish to acknowledge the constructive criticism of R.E. Harbach, E.L. Peyton, J.F. Reinert and R.C. Wilkerson, who reviewed various drafts of the manuscript. Conversations with E.L. Peyton and R.E. Harbach on taxonomic problems were most fruitful. Thomas F. Gaffigan's careful curation of the U.S. National Mosquito Collection unearthed a 'lost' holotype and furnished additional data on a

number of species. The Smithsonian Institution Libraries were extremely helpful in obtaining many of the Chinese references.

A special acknowledgment is due my daughter, Katherine B. Ward, for cheerfully processing the numerous drafts of this manuscript. The final preparation of the diskette was accomplished by J.E. Pecor, who always does a superb job.

TAXONOMIC NOTES

1. Marks (1976) removed *Anopheles corethroides* from synonymy with *An. stigmaticus* Skuse through publication of the name in a list of the Culicidae of the Blackdown Tableland, Australia. Although she did not provide an explanation for the removal of *An. coreth-*

roides from synonymy, such a justification verifying the specific status of *An. corethroides* was provided in Lee et al. (1988a:54).

2. Hii et al. (1988) discussed the surname of the author of *Anopheles sulawesi* and pointed out that it should be Waktoedi rather than

Koesoemawinangoen as used by Knight and Stone (1977). According to Indonesian custom, the surname precedes the first name of an individual. Therefore, species described or coauthored by Waktoedi Koesoemawinangoen should have Waktoedi designated as the author. The following taxa listed with Koesoemawinangoen as sole or junior author need to be attributed to Waktoedi: *Anopheles (Anopheles) gigas pantjarbatu* Waktoedi, *Anopheles (Cellia) ludlowae torakala* Stoker and Waktoedi, *Anopheles (Cellia) sulawesi* Waktoedi [prior attribution by Hii et al. (1988)], *Anopheles (Cellia) tessellatus kalawara* Stoker and Waktoedi and *Anopheles (Cellia) albino* Stoker and Waktoedi (= *An. vagus*).

3. Gillies and Coetzee (1987) did not designate a type specimen nor the type depository in their original description of *Anopheles (Cellia) lounibosi*. Townsend (1990:96) suggested that the holotype might be in the ORSTOM collection at Bondy, France. In a 1991 letter, M.T. Gillies stated that the holotype was a 4th instar larva which was deposited in the Natural History Museum, London, with the following label: *Anopheles rabaiensis*, 28.vi.1977, coll. L.P. Lounibos in Pandanus rabaiensis, Kombeni R., Rabai, Kilifi Dist., KENYA.

4. Gillies and Coetzee (1987) did not mention the sex of the adult type specimen when they described *Anopheles (Cellia) vaneedeni*. Townsend (1990:146) stated that the holotype was a male. However, M.T. Gillies stated in a 1991 letter that he visited the Natural History Museum and examined the holotype which was a female. The specimen label reads: Pusela, Tzaneen, resting outside. det. M. Coetzee.

5. Townsend (1990:147) stated that the Natural History Museum collection contained nine syntypes of *Anopheles (Cellia) varuna* from Sri Lanka. These specimens cannot be syntypes as Iyengar (1924:25) stated: "Described from a type female and many co-type females from the vicinity of Calcutta, collected by me." Iyengar does mention an unspecified number of specimens of *An. varuna*

collected by R. Senior-White at Matale, Ceylon, but in no way could these specimens be construed as syntypes. The current location of Iyengar's type and cotypes is unknown (Harrison 1980).

6. The original description of *Aedes (Aedimorphus) bambiotai* did not mention the type locality other than give the country. Thomas F. Gaffigan examined the holotype male in the USNM and observed the following information upon the specimen labels: Ivory Coast:/Andiopodoume forest/RF 1-No. 1/-23.06.86/Ae bambiotai/B. Geoffroy Rec Det.//Holotype/Ae. (Adm.)/bambiotai/Geoffroy.

7. *Aedes (Finlaya) gilcolladoi* was described by Sanchez-Covisa V. et al. (1985) from an unspecified number of larvae (more than 50) with neither a type designation nor a specified type locality other than "Espana Peninsular." The above specimens must be considered syntypes according to the ICZN 1985, Article 73b. Attempted correspondence to the authors did not produce a reply.

8. Knight and Marks (1952) designated a neotype female for *Aedes (Finlaya) mallochi* Taylor since they could find no specimens from the type series. In 1990, Townsend mentioned the presence of a syntype female in the Natural History Museum (BM) collection. Since this constitutes the rediscovery of a name-bearing type, this situation should be referred to the ICZN to rule whether the neotype of Knight and Marks is or is not to be retained as the name-bearing type (ICZN 1985, Article 75h).

9. The validity of the species name *Aedes (Levua) geoskusea* was discussed in detail by Lee et al. (1984:44), who contend that *Ae. suvae* Stone and Bohart, 1944 was the first validly published name for this species. I concur with the interpretation of Knight and Stone (1977) that *Ae. geoskusea* is a valid name on the basis of publication and priority (ICZN 1985, Articles 11a, 11b, 13a(i) and 23a).

10. The National Institute for Virology (NIV) maintained a number of type specimens after it became independent from the South Afri-

can Institute for Medical Research (SAIM). The primary types remaining at both institutes were listed by Segerman (1990). The disposition of the holotype of *Aedes (Ochlerotatus) juppi* was not mentioned in Segerman's paper. In a 1991 letter, J. Segerman stated: "I have checked with Dr. Peter Jupp at the National Institute for Virology and he tells me that the Holotype and Allotype of *Aedes (Ocherotatus) juppi* are both still housed there."

11. The original description of *Aedes (Rusticoidus) krymmontanus* omitted the exact type locality, sex of the holotype and type depository. A letter from E. V. Alekseev (1992) only mentioned the "southern and northern mountainsides of Crimean mountains . . . in the neighborhoods of Simferopol, Bachisaray, Alushta, Yalta and Pheodosia" and that the holotype was in the author's collection.

12. Stone et al. (1959) and Knight and Stone (1977) were usually quite accurate in their listings of the original descriptions of Culicidae in their catalogs. In the instance of two Afrotropical *Aedes* species, *Aedes (Stegomyia) calceatus* and *Aedes (Stegomyia) soleatus*, they erred by 17 years. They evidently missed the description of these two species by Edwards in 1924 in an appendix to a paper by W.E. Haworth and attributed both species to Edwards (1941). Townsend (1990) provided the correct citations.

13. A lectotype for *Aedes (Verrallina) varietas* was designated by Knight and Hull (1953:474) for the single male specimen from the type series in the BM. The identity of the specimen was subsequently confirmed by both Delfinado (1968:40) and Reinert (1974:92) even though the specimen lacked a lectotype label. Townsend (1990:147) affixed a label to the specimen and stated: "LECTO-TYPE male . . . here designated." Although Recommendation 72E of the ICZN (1985) recommends that name-bearing types should be labeled in such a manner that will unmistakably denote their status, the previous descriptions of the Knight and Hull lectotype were such that no confusion could occur con-

cerning the status of the specimen. Thus, the subsequent designation by Townsend (1990) was unjustified.

14. Townsend (1990:77) changed the status of *fuscus* from a synonym of *Armigeres (Armigeres) malayi* to a valid species. Since no justification was provided for this changed status, it should be considered as an unjustified action. A similar situation exists in respect to the improper elevation of *clavipalpus* from a subspecies of *Mimomyia (Mimomyia) chamberlaini* (Townsend 1990:61).

15. Belkin et al. (1968:13) indicated that the type of *Psorophora (Janthinosoma) chaquensis* was not present in the Instituto Nacional de Microbiologia, Buenos Aires, according to O.H. Casal. An acknowledgment was given to Alan Stone for examining material in the USNM so it may be assumed that Stone too did not find the type. While curating the USNM mosquito collection in 1992, T.V. Gaffigan found an adult female in a tray containing *Psorophora lutzii* which conformed to the description of the single female type described by Paterson and Shannon (1927:9) from Tres Pozos, Embarcacion, Salta. The specimen bears four labels in hand-printed letters, reading from top to bottom: 1) Tres Pozos/Embarcacion/Salta, 20-4-27/E. S. Shannon; 2) Type/Psorophora/chacoensis [sic]/Paterson &/Shannon; 3) Psorophora/lutzii/Theob.; and 4) Psorophora/albipes Th. This specimen is undoubtedly the missing holotype.

16. Sirivanakarn (1976:151) designated a lectotype for *Culex (Culex) fuscifurcatus*. This was an invalid selection as Townsend (1990:77) stated that the holotype male of *fuscifurcatus* was deposited in the Natural History Museum.

17. Sirivanakarn (1976:159) designated a lectotype for *Culex (Culex) mimulus* from one of the two syntypes of this species from Kuching, Sarawak. However, Townsend (1990:105) said that Sirivanakarn did not label the lectotype specimen nor did he provide an indication in his paper which individual should be the lectotype. Since insufficient

data were presented for the recognition of the lectotype, this selection was invalid (ICZN 1985, Article 74b, Recommendation 74C).

18. *Culex (Culex) telesilla* was described from seven larval and seven pupal exuviae without designation of a type (de Meillon et al. 1945:91). The adult male and female of *Cx. telesilla* were later described by de Meillon (1947) with the statement: "The description of the larva of this species (De Meillon et al, Bull. ent. Res., 36, 91, 1945) was quoted from a manuscript by De Meillon and Lavoipierre. Mention of this was unfortunately omitted." De Meillon also stated that the types were deposited in the SAIM. Although de Meillon may have intended that an adult male be designated the holotype, the name *Cx. telesilla* must be based upon the specimens mentioned in the 1945 publication. These specimens should be considered syntypes; from which a lectotype can be designated.

19. Sirivanakarn (1972:52) designated a lectotype for *Culex (Culex) hackeri*. Townsend (1990:81) indicated that this was an invalid designation as Edwards labeled and designated a holotype male in his original publication.

20. Lee et al. (1989b:105) stated that the lectotype male of *Culex (Lophoceraomyia) fraudatrix* which was designated by Sirivanakarn (1968:156) was the same specimen which Colless (1960:256) used for the lectotype of *fraudatrix*. Since Sirivanakarn's designation of a lectotype (1968) occurred eight years after Colless' designation (1960), the later designation has no validity (ICZN 1985, Article 74a).

21. Sirivanakarn (1977:132) designated a lectotype for *Culex (Lophoceraomyia) hewitti*. This was deemed unnecessary by Townsend (1990:82), who said that Edwards plainly indicate one of the males from the type series as the holotype.

22. Neil L. Evenhuis (1990 letter) was unable to find the holotype of *Culex (Lophoceraomyia) pseudorubithoracis* at the Bishop Museum where it was presumably deposited by the author. A search for the type in the USNM

by T.F. Gaffigan did not reveal it either. At present the status of the type may be considered as location unknown.

23. Taylor (1914:201) described *Mansonia (Mansonioides) papuensis* from four females, but did not designate a type. Lee et al. (1988b:133) said the holotype of *Mn. papuensis* was in the ANIC. This specimen can only be considered a syntype which is of equal status to the syntype in the Natural History Museum (Townsend 1990:118) since no subsequent author designated a lectotype.

24. Del Ponte (1939:541) published the name *Wyeomyia (Dendromyia) subcomplosa* as a new species in a table enumerating 5 character states for the identification of adult female Sabethini. In the table, both *subcomplosa* and *Wyeomyia (Dendromyia) complosa* were listed as possessing the same five character states. Since Del Ponte did not provide a means of differentiating this taxon, the name *subcomplosa* is not available (ICZN 1985, Article 13a(i)) and may be considered as a *nomen nudum*.

TAXONOMIC INDEX

Valid genera and subgenera are shown in **bold face** except when they follow species names in which case they are *italicized*. Valid species and infraspecific names are *italicized*. Synonyms and invalid names are underlined. Where two pages are given after a generic name, the first refers to the genus and the second refers to the typical subgenus if on a different page.
